                                                                                                                                                                                                                                                                                                                                                                     The present sequence encodes a human DNA fragmentation factor subunit of 40 kDa, designated DFF40. The specification also describes DFF45. DFF40 is capable of inducing apoptosis, and may contain a nuclear localisation fragment. DFF45 acts as a molecular chaperone to direct the folding of DFF40. Although all DNase activity is associated with DFF40, DFF activity only occurs once DFF40 is complexed with DFF45. The DFF polypeptides and polynucleotides are useful for inhibiting the growth of cancer cells, and for inducing apoptosis of cells.
                                                                                                                                                                                                                                                                                                                                                        Sequence 2839

                                                                                                                   멍
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is a human DNA fragmentation factor 40 (DFF40) cDNA capable of inducing apoptosis. DFF is a heterodineric protein comprising 40KDa and 45KDa subunits. DFF45 acts as a molecular chaperone to facilitate the appropriate folding of DFF40 and acts as an inhibitor for DFF40. DFF40 and DFF45 are used in gene therapy. The modulators of human DFF40 activity are useful for inducing apoptosis and for treating hyperproliferative disorders such as restenosis, psoriasis, metastatic tumours, angiogenesis and benign and malignant neoplasias. They are also used for treating cancers of the brain (glioblastoma, astrocytoma, oligodendroglioma and ependymoma), lung, liver, spleen, kidney, lymph node, pancreas, small intestine, blood cells, colon, stomach, breast, endometrium, prostate, testicle, ovary, skin, head and neck, oesophagus, bone marrow, blood, other tissue and multi-drug resistant cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying modulator of human DNA fragmentation factor 40, for treating cancer, involves contacting cell or cell-free composition comprising DFF40 with candidate substance and comparing apoptosis with

```

The present sequence encodes a caspase activated nuclease (CPAN). Active CPAN proteins can be used for identifying compounds which inhibit apoptosis. Inhibitors of apoptosis can be used therapeutically, e.g. where cells are damaged and the apoptotic pathway is initiated such as by heart attack or stroke. The inactive CPAN proteins can be used for

Compounds which activate apoptosis can be used to treat tumours. The association of CPAN with a caspase-sensitive inhibitor suggests that when cells enter into apoptosis, the activation of caspases will trigger CPAN to become
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ...

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Š
                   The present sequence encodes a human DNA fragmentation factor, designated DFF40. Also described are: (1) a method of inducing apoptosis in a cell comprising providing the cell with DFF40 which results in apoptosis; (2) a method for inhibiting the growth of a cancer cell comprising contacting a cancer cell with a DNA fragmentation factor designated DFF40 under conditions permitting the uptake of the DNA cases conditions permitting the uptake of the DNA cases cell induces apoptosis; (3) a method for treating cancer comprising: (a) encoding a DFF40 DNA fragmentation factor; and (b) a promoter active in the tumour cell, where the promoter is operably linked to the region cencoding the DNA fragmentation factor, under conditions permitting the uptake of the nucleic acid by the tumour cell; (4) a method of identifying a modulator of DFF40; and (5) a method of producing a functional DNA fragmentation factor. An expression construct encoding a DNA fragmentation factor. An expression construct encoding a DNA fragmentation factor. An expression construct encoding a low of induce apoptosis, especially in tumour cells. DFF40 is used to inhibit the growth of a cancer cell, especially in humans.
                                                                                                                                                                                                                                                                                                                                                                                                   Wang
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Homo

                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes an inhibitor (ICAD) for caspase-activating DNase (CAD). Two ICAD's are specifically claimed: a long chain form (ICAD-L) and a short chain form (ICAD-S). ICAD and ICAD can be used in the prevention of cell death, and can be used as a research reagent for cell death. The present sequence encodes mouse CAD which is used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation; ss.
The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities,
                                                                                                                                                          Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                        07-SEP-2001.

```
CC comprising the sequences given in AAZ12532 to AAZ1779. Also described is CC camerhod of detecting differentially expressed genes correlated with the CC cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels. CC mapping, tissue typing or profiling, forensics, genetic analysis and CC detection of polymorphisms. Polypertides encoded by the polynucleotide can be used for raising antibodies for experimental, diagnostic and CC therapeutic purposes. The polynucleotides may also be used to construct CC arrays for diagnostics (which may be used to determine function of an CC conced protein), and to detect differences in expression levels between coded protein, and to detect differences in expression levels between CC diagnostis, prognosis and management of odiseased tissue in a human, to CC cancer). The polynucleotides of the invention are especially used in the CC diagnosis, prognosis and management of colorectal cancer, breast cancer, and lung cancer. The polynucleotides can also be used to screen for CC peptide analogues and antagonists.

The inventiuseful in developmental biology and in elucidating cell signalling a cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABJ16176-ABJ30511), expressed DNA sequences (ABJ16176-ABJ30511), expressed DNA sequences (ABJ16176-ABJ30511).

(GENE-) GENE LOGIC INC

Beazer-Barclay Y, Weissman XX, Yamaga ß Vockley

WPI; 2002-435328/46.

Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and

Claim 1; SEQ ID No 1334; 114pp; English

CC GC, where differential expression of Gs is indicative of GCA.

Also included are modulating (M2) GA by contacting GC with an agent capable of modulating GCA or an inflammation (especially CC chronic) in a tissue, an allergic response in Gs: (2) screening (M3) CC chronic) in a tissue, an allergic response in a subject, exposure of a cubject to a pathogen or sterile inflammatory disease using the CC chronic) in a tissue, an allergic response in a subject, exposure of a cubject to a pathogen or sterile inflammatory disease using the CC chronic) in a tissue, an allergic response in a subject, exposure of a cubject to a pathogen or sterile inflammatory disease, by detecting the correct the level of expression of the gene is indicative of inflammation; (4) treating (M5) an inflammation (especially chronic) or in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammation (especially chronic) or in a tissue, or sterile inflammation with an agent that modulates the expression of gene(s) from GS in the tissue. M1 is useful for detecting a tissue having the detecting an inflammation (especially chronic) or in a tissue, an allergic response in a subject, exposure of a subject capable of modulating GCA preferably in an inflammation in a tissue; M1 is useful for creening an agent that modulates the expression of gene(s) from GS in the tissue, an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease (e.g. psoriasis, rheumatoid arthritis, or a sterile continuation of disease (e.g. psoriasis, rheumatoid arthritis, creperfusion injury, renal processed in granulocytes.

CC parasitic infection, protozoal infection, fungal infection and M5 is useful for treating one of the above conditions. The present condition of the printed specification, but was obtained in electronic condition in the printed specification, but was obtained in electronic conditions. The present conditions are present c (GCA), by detecting the level of expression of gene(s) DNA chip analysis as given in the specification, and counter the expression level to an expression level in an unac-The invention relates to detecting (M1) granulocyte an unactivated and comparing (GC) (GS) identified уd

The present invention describes the full length genome of Neisseria meningitidis B (NNB). The Sequences in AAR721544 and AAF21607 to AAF721613 represent fragments of the NNB genomic sequence, as the sequence was too long to go in a record on its own it was split into 8 sequences which overlap each other at the beginning and end of each sequence by 49980 bp (1.e. the last 49980 bp of AAF21547 are repeated at the beginning of AAF21607, the last 49980 bp of AAF21607 are repeated at the beginning of AAF21608, and so on). AAF721545 to AAF21588 encode the Neisseria proteins given in AAB58550 to AAB58553 and AAF21589 to AAF21606 represent PCR primers which are used in the exemplification of the present invention. The NNB genome and fragments from it have antibacterial activity, and can be used in vaccines and gene therapy. Neisseria nucleic acids, proteins and/or antibodies which binds to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 7; Appendix A; 692pp; English.

Computers, computer memory, computer storage medium or computathabases can be used in a search to identify open reading frames (ORF or coding sequences within the NMB genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins which

The present invention describes methods of obtaining immunogenic CC proteins from Neisseria genomic sequences. AAA81453 to AAA82414 CC represent specifically claimed Neisseria meningitidis genomic DNA CC sequences; AAA81260 to AAA81303 and AAB25620 to AAB25663 represent Neisseria DNA sequences and their corresponding proteins; AAA81254 to AAA81259 and AAA81304 to AAA81321 represent PCR primers used in the claim of Neisseria meningitidis DNA sequences; and AAA81322 to AAA81259 and AAA81304 to AAA81321 represent PCR primers used in the claim of Neisseria meningitidis DNA sequences; and AAA81321 to AAA81452 represent Neisseria meningitidis MAN polynucleotide ORF sequences, which are all used in the exemplification of the present composition. The nucleic acid sequences, protein sequences, and antibodies against them, can be used in the manufacture of a composition can be used as a medicament (or in the manufacture of a medicament) for treating, preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococcus B; against all serotypes; and/or against all pathogenic Neissariae. Identification of sequences and/or against all pathogenic Neissariae. Identification of biological probes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAA81490
                                                                                                                                                                                                                                                                                                              Claim 7; Page 866-1272; 1760pp;
                                                                                                                                                                                                                                                                                                                                             other Neisserial infections, for example,
                                                                                                                                                                                                                                                                                                                                                             Isolated nucleotide sequences of Neisseria used in the diagnosis and treatment of N. \mathbf{n}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  09-OCT-1998;
